

POWER AT YOUR FINGERTIPS

Human kind is a species that thrives on communication. The transmissions of ideas, instructions and knowledge have, over the millennia, carved order and civilisation from the randomness of nature.

TOUCHNET

Left to its own devices, a business will eventually revert to chaos. It needs a binding force to prevent its components from aimlessly drifting (making it easy prey for the competition). That unifying bond is communication. From the boardroom to the field, from the depot to the client, getting information delivered precisely and quickly is what keeps business advancing as a unit. TouchNet and TouchNet+ satisfy the dual requirements of effective interaction: precision and speed.

The TouchNet system isn't TouchNet Minus; it's an indispensable multi-platform communication tool that can homogenise a mobile or static network whose components run on different operating systems of various ages (i.e., your network).

TOUCHNET / TOUCHNET + Key Benefits

- Faster routing to customers
- Savings on time and fuel
- Instant access to key customer information
- Adhoc and scheduled deliveries
- Improved routing and scheduling

TOUCHNET

TouchNet+ is a piece of software that again runs on any platform and allows instant transmission and reception of critical files. It is ideal for distributing vital new information to a whole network or very specific data to an individual out in the field. Because the software runs silently in the background until called upon, and uses processor power efficiently, it hardly impacts on battery life or the smooth running of key applications.

Whether used separately or together, TouchStar's network unification solutions make information a readily exchangeable

asset in your business's portfolio. From the moment it's installed, staff working in the field and those back in the office are afforded a fluency of communication whose absence was always the weakness of a diverse network. At last, the promises of the mobile workforce have been delivered; its immeasurable advantages are no longer conditional. Without a means of data communication this complete, can you seriously assert that all members of your organisation are in the loop?
